

Mckyle Meyer

Full-Stack Software Developer

Pretoria, Gauteng, South Africa · mckylemeyer12@gmail.com · in/mckyle-meyer · github.com/MckyleM · me.mckyle.dev

SUMMARY

Full-stack developer on a production C#/.NET platform — ASP.NET Core services with Blazor and React front ends — who ships products end-to-end: most recently a Microsoft Outlook add-in built as a React/TypeScript task pane on a .NET backend and deployed multi-container on Azure. Uses AI aggressively as an engineering multiplier: agent-readable knowledge vaults, code knowledge graphs for pre-refactor impact analysis, and locally served LLMs.

EXPERIENCE

Software Developer — Financial-services software company Oct 2024 – Present

Gauteng, South Africa

Develops a financial-services practice-management platform (.NET) spanning a legacy ASP.NET Core MVC application and a modern microservices line.

- Built a Microsoft Outlook add-in end-to-end: a React/TypeScript task pane backed by a .NET BFF that proxies to internal services via OpenAPI-generated typed clients (NSwag) and renders emails to PDF through a headless-Chromium sidecar; shipped to production on Azure as a multi-container deployment.
- Designed and implemented OIDC authentication for a Microsoft Outlook add-in (Office.js) using a Backend-for-Frontend with a one-time-code server-side relay — working around Outlook-on-the-Web’s broken dialog-messaging channel — and configured ASP.NET Data Protection key persistence so sessions survive restarts and scale-out.
- Set up and scaled the platform’s automated test project (Playwright/TypeScript, CI in Azure Pipelines) so UI changes ship without manual regression passes: wrote the first ~130 of its ~300 tests and eliminated flaky failures from UI virtualization and fixed-timeout waits.
- Trained 3 interns (Sep 2025 – Feb 2026), taking them from zero Playwright/TypeScript experience to independently maintaining the ~300-test suite.
- Leading the extraction of a settings module out of a large CRM application into a standalone app: dependency injection, state management and namespaces re-architected across 30+ components, services and models while both solutions keep building green.

PROJECTS

Aloe Ferox Algorithm (Python, PyTorch, Dash) — A computer-vision classifier that recognises Aloe ferox plants from photographs — PyTorch models trained in Jupyter, a data script that builds its own train/test image sets, and a Dash web app for running predictions.

Card-fraud detection (Python, scikit-learn, Dash) — A classical-ML pipeline on card-transaction data — logistic regression, decision tree and random forest trained and compared in a step-by-step notebook, with the final model served through a Dash web app deployed to Render.

This website (React, Cloudflare Workers) — React + Vite portfolio on Cloudflare Workers; site and resume PDF render from one data file.

EDUCATION

Bachelor of Computing (NQF 8) — Belgium Campus 2022 — 2025

Matric — HTS Middelburg 2017 — 2021

SKILLS

Languages	C# · TypeScript / JavaScript · Python · SQL
Frameworks	ASP.NET Core · React · Blazor
Cloud & infrastructure	Cloudflare Workers · Azure (multi-container deployments, Blob Storage) · Docker · Git
APIs & testing	OpenAPI / REST (NSwag typed clients) · Playwright
