

Mckyle Meyer

Software Developer

Pretoria, Gauteng, South Africa · mckylemeyer12@gmail.com · in/mckyle-meyer · github.com/MckyleM · meetmckyle.mckylemeyer12.workers.dev

SUMMARY

C#/.NET developer on a production financial-services practice-management platform — Blazor front ends and ASP.NET Core services across a multi-repo architecture. Strongest at authentication flows, cross-service API contracts, and refactoring at scale. Builds AI-augmented engineering workflows: agent-readable knowledge vaults, code knowledge graphs for pre-refactor impact analysis, and locally served LLMs.

EXPERIENCE

- Software Developer — Financial-services software company**Oct 2024 – Present
- Gauteng, South Africa
- Develops a financial-services practice-management platform (.NET) spanning a legacy ASP.NET Core MVC application and a modern Blazor/microservices line.*
- Designed and implemented OIDC authentication for a Microsoft Outlook add-in (Office.js) using a Backend-for-Frontend with a one-time-code server-side relay — working around Outlook-on-the-Web’s broken dialog-messaging channel — and configured ASP.NET Data Protection key persistence so sessions survive restarts and scale-out.
 - Leading the extraction of a settings module out of a large Blazor CRM application into a standalone app: dependency injection, Fluxor state and namespaces re-architected across 30+ components, services and models while both solutions keep building green.
 - Built a Microsoft Outlook add-in end-to-end: a React/TypeScript task pane backed by a .NET BFF that proxies to internal services via OpenAPI-generated typed clients (NSwag) and renders emails to PDF through a headless-Chromium sidecar; shipped to production on Azure as a multi-container deployment.
 - Set up and scaled the platform’s automated test project (Playwright/TypeScript against a Blazor UI, CI in Azure Pipelines): wrote the first ~130 of its ~300 tests, eliminated flaky failures from UI virtualization and fixed-timeout waits, and ran 250-iteration stability loops to surface intermittent failures before CI.
 - Trained 3 interns (Sep 2025 – Feb 2026), taking them from zero Playwright/TypeScript experience to independently maintaining the ~300-test suite.

PROJECTS

- Smallpenny** (Python) — A working blockchain built from scratch — blocks, hashing, proof-of-work and chain validation.
- Transformer from scratch + 1-bit QAT** (Python, PyTorch) — Llama-style decoder in a single PyTorch file (RMSNorm, RoPE, SwiGLU) with 1-bit QAT — 1.125 bits/weight, loss 4.2 → 2.32.
- This website** (React, Cloudflare Workers) — React + Vite portfolio on Cloudflare Workers; site and resume PDF render from one data file.

EDUCATION

- Bachelor of Computing (NQF 8)** — Belgium Campus2022 — 2025
- Matric** — HTS Middelburg2017 — 2021

SKILLS

- Languages**C# · TypeScript / JavaScript · Python · SQL
- Frameworks**ASP.NET Core · Blazor · React
- Cloud & infrastructure**Azure (Blob Storage) · Docker · Git
- APIs & testing**OpenAPI / REST (NSwag typed clients) · Playwright
